

Acknowledgments

Grateful appreciation is hereby expressed for the invaluable assistance received from the following eminent professors and/or research scientists. Their taking time to share information from their wealth of professional knowledge is not to be construed as any endorsement of this book. There was no occasion for some of them to know the author's views, and it is probable that some would differ strongly with certain of the conclusions reached herein. These scientists represent a variety of viewpoints, yet all courteously shared information on particular subjects via mail or telephone. In alphabetical order, the following are among those who were most helpful:

Harry Block, University of Liverpool
James Bonner, California Institute of Technology
Larry Butler, Purdue University
Melvin A. Cook, IRECO Chemicals
Margaret O. Dayhoff, National Biomedical Research
Foundation
Robert DeLange, University of California at Los Angeles
Arthur Elliott, King's College, London
Sidney W. Fox, University of Miami
Jesse L. Greenstein, California Institute of Technology
Philip C. Hanawalt, Stanford University
Joseph L. Henson, Bob Jones University
Thomas R. Howell, University of California at Los
Angeles
Norman Hughes, Pepperdine University
John C. Kendrew, Cambridge University
Elias Klein, Gulf South Research Institute
Harold J. Morowitz, Yale University

Marshal W. Nirenberg, National Institutes of Health
John H. Ostrom, Yale University
Linus Pauling, Stanford University
George Preston, California Institute of Technology
John G. Read, Hughes Aircraft Company
Fred D. Williams, Michigan Technological University

We are grateful to Dr. Arthur Kornberg of Stanford University for his courtesy in providing an electron micrograph of DNA and permitting its use.

Biologists George F. Howe and Bolton Davidheiser kindly read the manuscript before revisions and offered vital encouragement. In addition, Dr. Howe played a key role in generously going out of his way to advocate publication and offer assistance to that end. Earlier a class taught by Dr. Davidheiser had much to do with inspiring the author to go into this field.

Dr. Kenneth L. Perrin, mathematician, helped to ascertain the "substitution formula," used in calculations involving multiple substitutions.

Mrs. Louise Carroll exhibited her characteristic careful excellence in typing and correcting the manuscript from very rough drafts. Mrs. Lavonne Cart cheerfully typed prodigious quantities of research notes.

The California Graduate School of Theology, recognizing the importance of the subject, allowed the author to do extensive research in biology and probability theory for his doctoral dissertation in this essential field of science and religion. This contributed greatly to the scope and early appearance of this book.
